Remote Work and Team Productivity

A. Author

October 23, 2026

Abstract

Remote work has fundamentally reshaped how organizations think about productivity. We study 1,200 employees across 14 firms and find that hybrid schedules raise self-reported output by 7.5% while reducing commuting time by 52 minutes per day.

1 Introduction

The rapid expansion of remote work over the past several years has changed the way organizations plan collaboration [1, 2]. As shown in Fig. 1, adoption grew from 12% in 2019 to 41% in 2022. Prior work by Martínez et al. [3] measured output with a simple model $y = \alpha + \beta x$, where β captures the effect of distance.

Our main contributions are:

- A panel of 1,200 employees observed over 24 months in *14* firms.
- An estimate of the effect of hybrid schedules on output, see Eq. (1).

2 Method

We estimate the following model:

$$y_{it} = \alpha_i + \beta \, \mathrm{hybrid}_{it} + \varepsilon_{it} \tag{1}$$

where y_{it} is the output of employee i in month t. Standard errors are clustered by firm, and the sample excludes the first 3 months of 2020.

Group	Output	Commute (min)
Hybrid	1.075	38
Office	1.000	90

Table 1: Main results.

Figure 1: Adoption of remote work, 2019–2022.

3 Conclusion

Ultimately, there is no one-size-fits-all answer. Hybrid schedules raised output by 7.5% in our sample, a result that holds across all 14 firms ($p < 0.01$).
